PCBN FOR CAST IRON MACHINING

Cutting materials and inserts for
turning, grooving and milling

AEROSPACE

The aerospace industry places extremely high demands on machining. In this field, machining capacity and process safety are the decisive parameters, and our CSA cutting materials together with our Monsoon Tool Technology tools are the optimal solution.

Component examples: Jet engine components such as blisks

AUTOMOTIVE INDUSTRY

For over 50 years, precision tools from CeramTec have been an integral part of highly productive machining solutions for components from the automotive industry. With our tool solutions, the implementation of concrete cost savings and increased productivity is always top priority.

Component examples: Brake discs, gear components, fly wheels, clutch plates, brake components, drive shafts, hydraulic elements, engine/motor components

MACHINERY AND PLANT ENGINEERING

Manufacturing complex components made of different materials with extreme precision and optimal surface quality in an economic way – that is the basic structure of requirements for which we work together with our customers to create innovative, cost-efficient machining solutions.

Component examples: Gearbox housing, flanges, guides, shafts, rollers

WIND ENERGY

In the field of wind energy, components mostly require special machining solutions, since the components involved are often especially large. Strict tolerance requirements and a high level of surface quality place extreme demands on the cutting materials and tool holders. By observing and analysing the determining factors for machining, we are able to provide our customers with extremely efficient and cost-effective machining solutions.

Component examples: Rotor flange, rotor blade connections, planetary gear holders, gearbox housing, gear components

GEAR TECHNOLOGY, DRIVE TECHNOLOGY AND BEARING INDUSTRY

Surface quality, tolerances and the tool life of the cutting materials are the standards for quality for hard machining. Our unique range of cutting materials made of PcBN and ceramic, together with our perfectly matched tools, set the bar in this industry. In practice, this results in highly efficient and cost-effective machining.

Component examples: Gear wheels, shafts, large gearbox components, bearing rings and rolling elements

VEHICLE MANUFACTURING INDUSTRY

MOTOR INDUSTRY

The high-performance materials that are used in this industry require cutting materials that ensure an extremely high level of process reliability and a consistently high quality level. Our cutting materials and tools are the perfect solution.

Component examples: Connecting rods, pulley wheels, cylinder heads, cylinder liners

TRANSPORT

When machining components for the transport industry, special solutions are often required in order for the machining process to remain economical and efficient. Our tools and cutting materials make these kinds of solutions possible.

Component examples: Wheel rims, shafts, bearings

AGRICULTURAL AND CONSTRUCTION MACHINERY

We offer highly efficient bearing solutions for components for agricultural and construction machinery. Our range of solutions are currently used for machining of soft steel as well as processing cast iron and hardened parts.

Component examples: Brake components, drive shafts, hydraulic elements, motor components

AUTOMOTIVE

For over 50 years, precision tools from CeramTec have been an integral part of highly productive machining solutions for components from the automotive industry.

Component examples: Brake discs, brake drums, fly wheels, connecting rods, gear components, engine blocks, Gehäuse

Machining cast iron materials

The machining of cast iron materials is characterised by high cutting values in order to achieve the highest possible machining capacity. It allows for a significant reduction in machining costs and a substantial increase in productivity. The continuous development of cast iron, however, is placing greater demands on the cutting material, the efficiency and the process reliability of high performance machining.

The complete tool system – the cutting material, cutting edge geometry, clamping system and the tool holder – must accommodate the high machining forces and the strong thermal, chemical and abrasive loads that occur

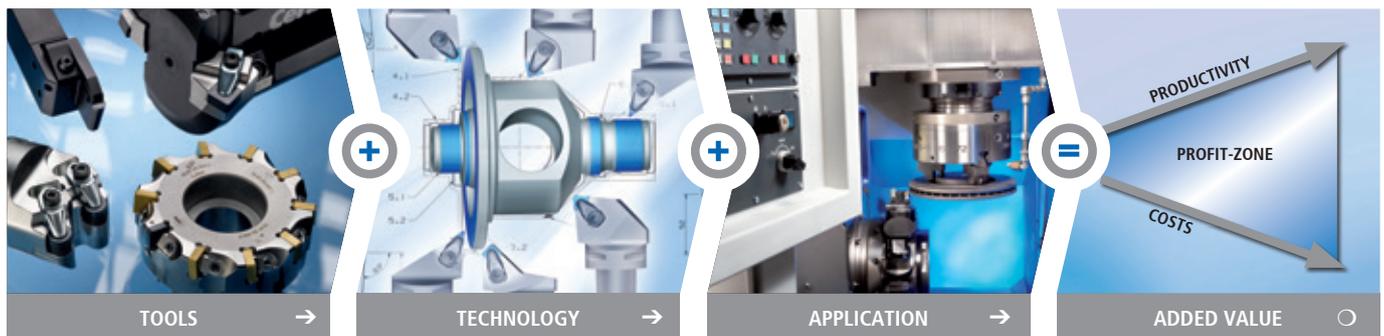

during high-performance machining, while ensuring process reliability.

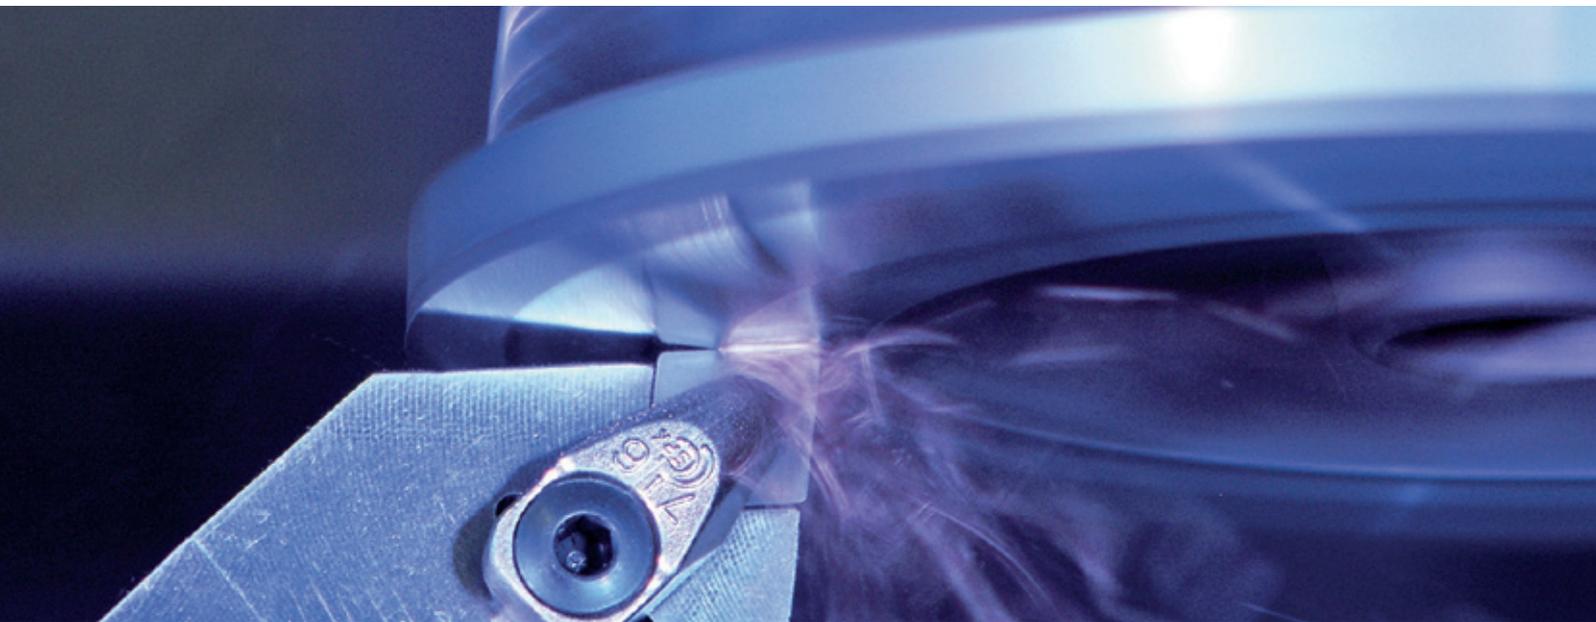

Other general conditions of production, corresponding to end user expectations, include a high-precision delivery at a reasonable price in the desired quality. A machining process that is technically optimised for maximum efficiency is therefore essential.

The goal is to incorporate not only the appropriate high-performance tool systems, but also high-end machining technology, comprehensive application know-how and fine-tuned tool logistics into the machining procedure.

With its extensive product and service port-

folio, SPK Cutting Tools – known as “SPK+ The Productivity Experts” – is rising to this challenge. The machining process is tailored to customer requirements and is perfected in its entirety; from the edges and technology used to machine application and tool logistics.

SPK-PCBN CUTTING MATERIALS FOR HPC TURNING OF CAST IRON

The unique and comprehensive range of PcBN high-performance cutting materials allows for the reliable HPC machining of cast iron workpieces. The materials are setting new standards with their superb

wear characteristics during both continuous and interrupted cuts as well as their impressive performance in terms of red hardness, compressive strength and chemical stability.

The cutting materials are also available with a coating for wear recognition upon request.

SPK-PCBN GRADES

WBN 101

This grade is ideal for turning and milling. Its extreme toughness and top wear characteristics make it possible to achieve high cutting values with continuous and interrupted cuts.

WBN 108

This PcBN grade is suitable for roughing of grey cast iron materials with moderate cutting data and high feed rates.

WBN 115

The high-performance machining specialist. Outstanding thermal stability combined with optimal toughness result in exceptional wear resistance for HPC machining.

This grade achieves remarkable results thanks to its high edge stability and excellent wear resistance, particularly when roughing.

WBN 750

The multi-tipped or laminated PCBN variant is intended for finishing and boring grey cast iron materials.

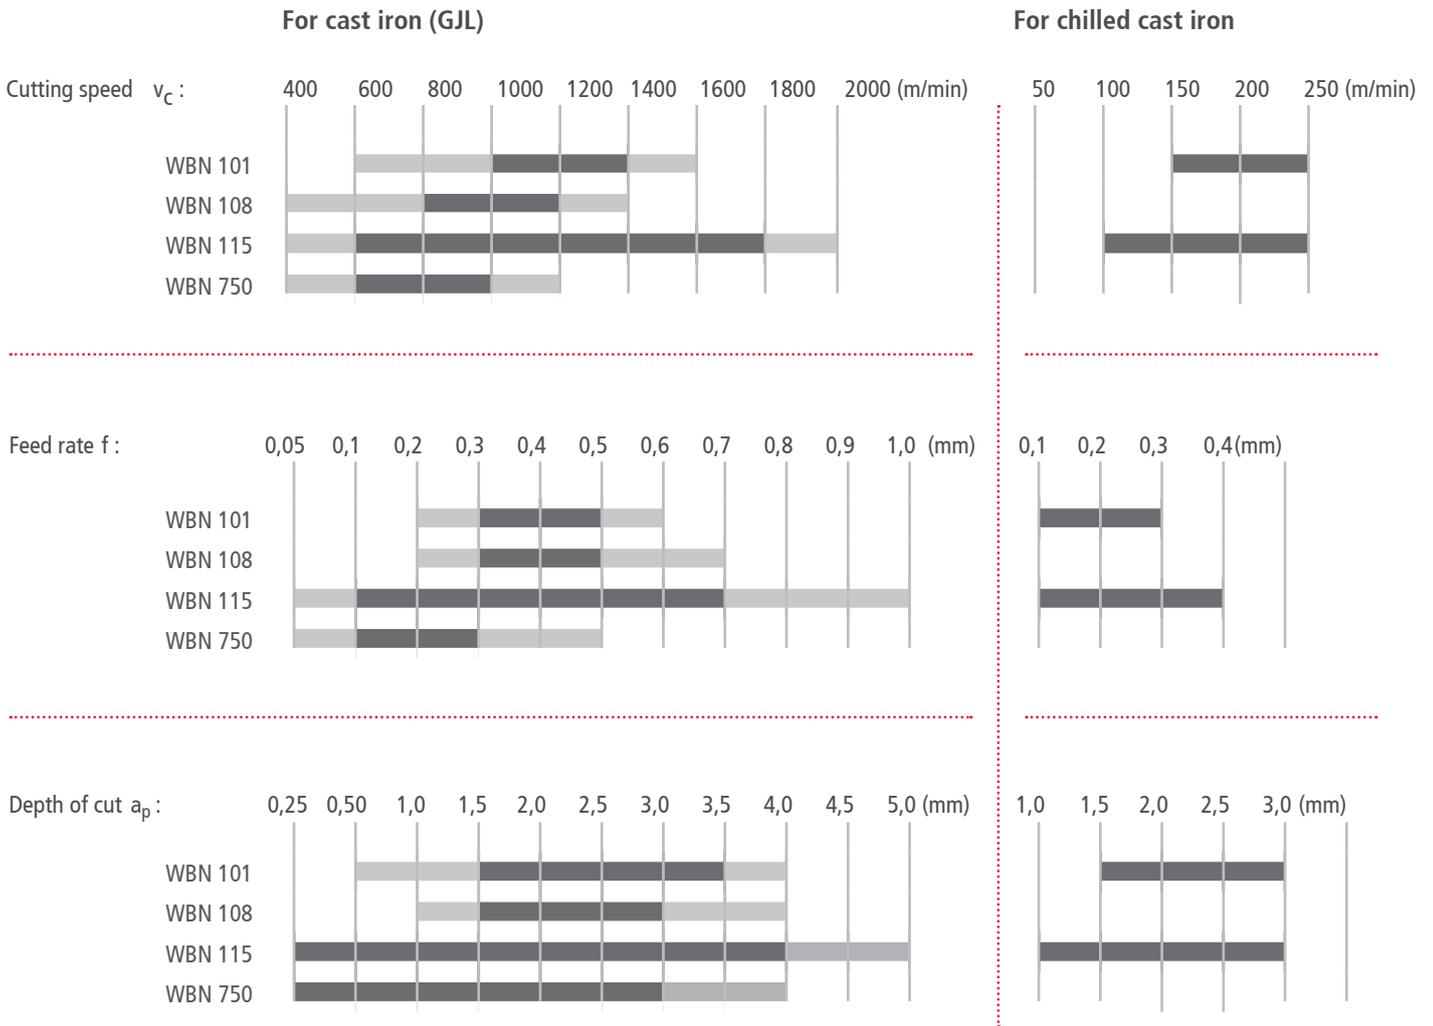

i SPK-PcBN grades for cast iron

IKS-PRO

High machining capacities in various cast iron materials also demand maximum performance from the tools. The IKS-PRO tool system is designed based on the requirements of high-performance processing. Combined with our ceramic and PcBN cutting materi-

als, they make an unbeatable team when it comes to high-performance machining. The patented notch geometry of IKS-PRO, the revolutionary clamping system, was developed especially for the simple and reliable clamping of inserts during HPC machining.

The principle of form-fit and force-fit clamping allows the cutting and feed speed to be increased significantly.

i The IKS-PRO principle

Laminar and for form-fit distributed clamping force with retraction into the insert seating

THE SYSTEM S3

The S3 tool holder and clamping system offers extreme process reliability along with minimal tool maintenance costs for cast iron machining with solid PcBN and ceramic inserts. Cast iron machining processes with long operation times and high cutting data require precision tool solutions that offer the highest level of process reliability while keep-

ing maintenance costs to a minimum. The design and the materials selected for the S3 system have been developed with precisely these requirements in mind. The S3 system's unique characteristics are a result of its innovative ODC Force clamping technology, optimised design and the use of a modern combination of materials. The optional high-

ODCFORCE clamping technology

The S3 clamping technology ensures that the clamping force is optimally distributed so that the insert is reliably clamped as a result. Part of the clamping force is applied directly to the insert powerfully, creating a form-fit seal. Two thirds of the clamping force retracts the insert into the insert seating.

temperature-resistant material version of the insert seating prevents the insert from expanding or becoming embedded in the insert seating. Thanks to these features the insert can be clamped extremely securely and reliably. This ensures maximum dimensional accuracy of the workpiece and a long tool life.

A MIX OF CUTTING MATERIALS IS ADVANTAGEOUS

The machining of cast iron materials is influenced by a number of factors. For example, the age of the casting – the time between the casting and the machining work – has a significant influence on the tool life. This requires alternative cutting materials, which can continue to achieve the required tool life and productivity even under the changeable conditions. As a manufacturer of ceramic high-performance cutting materials, CeramTec is able to supply its customers with alternative cutting materials within a

short period of time. This applies to both inserts in standard geometries as well as to custom designs. Furthermore, IKS-PRO clamping technology allows users to switch to alternative cutting material grades within seconds without having to adjust the entire tool system. Switching from ceramic cutting materials to PcBN and back is straightforward and does not require a refitting of the tools.

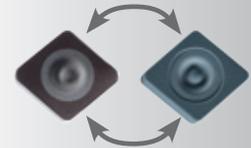

CUSTOMISED SOLUTIONS

i EASY Change Technology

EASY CHANGE
TECHNOLOGY

The IKS-PRO notch system allows users to switch from PcBN to ceramic cutting materials such as SiAlON without having to change the tool.

The differing size and complexity of cast components often demand sophisticated machining solutions that use special tools. Our engineering team assists customers with the goal of using as many standard tools as possible and as many special tools as required. Tool solutions are conceived for achieving optimum machining results and the highest level of efficiency. Solid, laminated and multi-tipped PcBN inserts are available for implementing customised inserts.

ZZ GEOMETRY

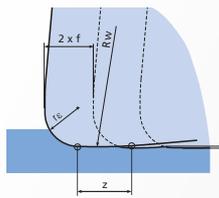

Every oak has been an acorn – this is probably the best way to describe the enormous increase in performance which can be achieved in finish-turning when using the ZZ geometry, also known in the industry as wiper geometry. The use of cutting inserts

with a ZZ geometry allows for significantly higher surface qualities to be achieved in comparison with inserts featuring standard geometries. Alternatively, the main machining times can be reduced considerably without any consequences to high surface quali-

ties. Therefore, the ZZ geometries represent one of the most efficient ways of increasing productivity in machining, especially in finishing operations.

i Advantages of wiper technology

ZZ GEOMETRY

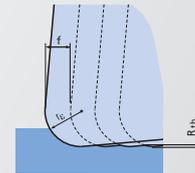

Equal feed rate
= doubled surface quality

Doubled feed rate
= machining times cut down by half

STANDARD GEOMETRY

Increase in production quality

Increase in productivity

TYPES OF CUTTING EDGES

A range of different tried and tested chamfer geometries are available for the various turning tasks. The chamfer selection will not only influence the tool life, but also the surface quality and dimensional accuracy

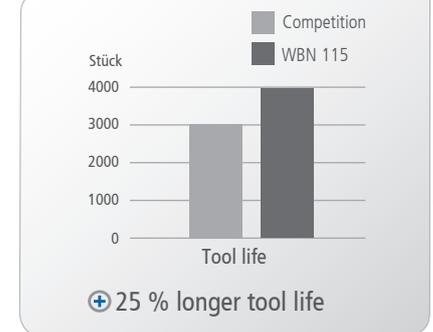

of the workpiece. For specific applications, optimising the chamfer may cause a supplementary increase in productivity.

40	4,0	Z	other angles	F	25°

Chamfer design

Chamfer width w_γ in 1/100 mm and angle γ_s without degree symbol

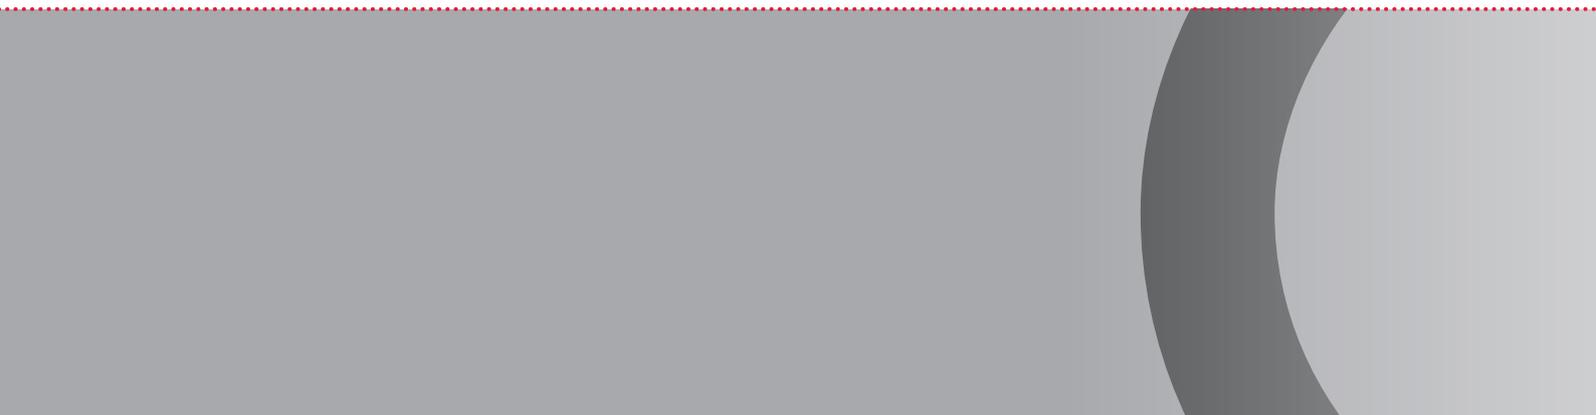

e.g.
 0,10 x 20° = 01020
 0,05 x 20° = 00520

CBN design

S	Solid CBN
----------	-----------

SPK-PcBN inserts for milling Solid
